TITLE: Steepening the front of a hv pulse by means of a nonlinear inductance

SOURCE: Priory i tekhnika eksperimenta, no. 1, 1965, 112-113

TOPIC TAGS: hv pulse, pulse front, pulse shaping

ABSTRACT: Steepening a pulse front may be achieved by inserting a nonlinear inductance between the transmission line and the load. The inductance (a ferrite-core winding) will be high during the voltage front and low (core saturation) after that. Hence, the current increases at first very slowly and then abruptly, and the current-pulse front becomes steep. Experimental verification was made with a piece of cable charged to 25 kv and then discharged into a 0.15- μ henry inductance. Front steepening from 30 nsec to 7 nsec was recorded by an oscillograph. TITLE: Propagation of electromagnetic waves in a ferrite inflector

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 35, no. 10, 1965, 1825-1833

TOPIC TAGS: cyclic accelerator, particle accelerator component, ferrite, electromagnetic wave

ABSTRACT: The author discusses the propagation of electromagnetic waves in an infinite plane line partly filled with ferrite magnetic material in order to assess the possible advantages of employing ferrites in the construction of inflectors for storage rings and deflectors for cyclic accelerators. The partly filled plane line was selected for discussion because it leads to tractable mathematics and is sufficiently like a real inflector so that the results derived for it are of practical interest. It is shown that the critical frequencies for TM waves are considerably above the frequencies that occur in the pulses employed for inflectors; TM waves, therefore, will not propagate in a ferrite inflector. The critical frequencies for TE_m waves with $m > 0$ are also high and these waves are also of no practical significance. The dispersion equation for TE₀ waves is derived and is discussed in detail for the two limiting cases of low frequency and high permeability. It is shown that in both cases

Card 1/2

UDC: 538.566

L 7752-66

ACC NR: AP5025895

the propagation velocity is nearly that of light in vacuum and that the waves closely approximate transverse TEM waves; in the case of high permeability the waves approximate TEM waves at all frequencies of practical interest. Expressions are derived for the electric and magnetic field strengths and for the stored energy. If the permeability is large the stored energy is $(d/2)W_{l.f.}$, where d is the dielectric constant and $W_{l.f.}$ is the stored energy for the corresponding iron-free inflector. The large stored energy is due in part to peculiar features of the model, and a greater advantage in this respect can be expected for practical inflectors. It is concluded that ferrites can be employed with advantage in inflector design. The author thanks V.D. Tkachenko and A.A. Sharshanov for valuable advice and a discussion of the results.

TITLE: Oscillography of magnetic-field pulses γ m

SOURCE: Izmeritel'naya tekhnika, no. 4, 1966, 90-91

TOPIC TAGS: magnetic field measurement, oscilloscope, electron beam, time signal/
OK-19M oscilloscope

ABSTRACT: The described method is based on direct action of the measured field on the oscilloscope beam, and is free of the distortion introduced by the intermediate elements (amplifier) used in other methods. The magnetic field is oriented in the horizontal sweep direction, and time pips are superimposed on the measured pulse. Any distortion inherent in the sweep circuit produces an equal effect on the time pips, so that the measuring accuracy depends only on the pip repetition frequency. The method was tested with an OK-19M oscilloscope and used to measure a magnetic-winding current pulse of 2000 a and 0.1 μ sec duration (field of several hundred Oe). The required deflection of the oscilloscope beam was obtained with the CRT placed 10-15 cm from the magnet. The method can also be used with arbitrary tube inclination relative to the magnetic force lines. Orig. art. has: 1 figure.

TITLE: A device for shortening the trailing edge of high voltage pulses. Class 21, No. 179357 [announced by Physicotechnical Institute, AN UkrSSR (Fiziko-tekhnicheskii institut AN UkrSSR)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 5, 1966, 34-35

TOPIC TAGS: pulse generator, pulse shape, pulse compression

ABSTRACT: This Author's Certificate introduces a device for shortening the trailing edge of high voltage pulses. Multiple reflections are eliminated when the load is a reactance or a mismatched resistance by connecting a three-electrode discharger and an inductance in parallel with each other and in series with the load. A symmetric delay line is connected to the electrodes of the discharger.

TITLE: Concerning the passage of strong waves in lines through a lumped inhomogeneity with a ferrite

SOURCE: Ukrayins'kyy fizychnyy zhurnal, v. 11, no. 7, 1966, 730-738

TOPIC TAGS: nanosecond pulse, pulse shape, ferrite, transmission line, magnetization, F-1000 ferrite, F-400 ferrite

ABSTRACT: This is a continuation of earlier work by the authors (PTE no. 1, 112, 1965), where it was experimentally demonstrated that the fronts of high-voltage nanosecond pulses can be made steeper with the aid of nonlinear inductances. Inasmuch as an earlier analysis of this phenomenon (by G. A. Mesyats and R. B. Baksht, ZhTF v. 35, no. 5, 889, 1965) using the Landau and Lifshits equations was limited to the case when the magnetic vector rotates without change in absolute magnitude, and is therefore not applicable to ferrites, the authors present an analysis, based on the modified Bloch equation, which takes into account the change of the magnetization in both magnitude and direction. The analysis yields a differential equation for the

Card 1/2

L 09352-67

ACC NR: AP6031314

output voltage of a nonlinear inductance; this equation is integrated for the case of a piecewise linear static magnetization curve. The results were checked experimentally by passing pulses of magnetic, with amplitudes up to 100 Oe (current pulse amplitude 50 - 100 A) through ferrites (F-1000 and F-400). The tests show that by suitable choice of parameters the results of the calculations can be reconciled with the experimental data. Measurements over a larger range of voltages are necessary to determine whether the Bloch equations or the Landau and Lifshits equations are more suitable. The authors thank G. A. Mesyats for a discussion of the results. Orig. art. has: 5 figures, 16 formulas, and 1 table.

TITLE: Characteristics of pulsed ferrite magnets with large magnetizing currents and under conditions of external constant magnetic fields

SOURCE: Priory i tekhnika eksperimenta, no. 3, 1966, 192-194

TOPIC TAGS: pulsed magnetic field, ferrite, magnetic field intensity, external magnetic field

ABSTRACT: This investigation examines the effect of core saturation on the magnitude and distribution of the pulsed field in a ferrite magnet. The pulse time was 0.1 microsecond. The dependence of the field in the gap upon the magnetizing current is graphed. With the windings inside the ferrite magnet gap, it is possible to attain pulse fields of approximately 7 kilooersted. It was found that the distribution of the magnetic field at 7 kilooersted differed very little from the distribution obtained at low magnetizing current. The performance of the ferrite magnets under conditions of constant external magnetic field is shown in figure 2. In any configuration, the ferrite MNTS-120, which has a large saturation inductance, possesses better characteris-

tics than the ferrite PH₂-400. In configuration (1) the field intensity is not reduced by the presence of an external constant magnetic field of any polarity up to 1 kilooersted. Curves I-1 and II-1 practically do not change with an increase in the pulse magnetizing current up to 1500 amp. An external constant magnetic field intensity up to 1 kilooersted has practically no effect upon the operation and distribution of the ferrite magnetic field. With further increase in the external constant magnetic field the distribution of the pulsed field largely approximates that in a nonferrous magnet. Orig. art. has: 3 figures.

oersted which was insufficient to saturate the ferrite plates. The winding had two turns which were placed symmetrically with respect to the middle plane of the magnet. Three winding configurations were used in the measurements. The distribution of leakage fields did not differ appreciably from that of coreless magnets. It was concluded that an increase in the thickness and length of the plates is of little advantage because the associated increase in the field and the changes in the leakage fields are very small. The leakage field remains substantially greater than for magnets with a closed path. Orig. art. has: 4 figures, 2 tables.

TITLE: Beam loading of a linear electron accelerator under transient conditions

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 36, no. 11, 1966, 2013-2016

TOPIC TAGS: linear accelerator, electron accelerator, spectral energy distribution, particle storage ring, particle injection

ABSTRACT: E.L.Burshteyn and G.V.Voskresenskiy (Nauchnyye trudy RIAN SSSR, III, No.3, 1961; Atomnaya energiya, 13, No.5, 466, 1962) have discussed the nonstationary effects associated with the beam loading of a linear electron accelerator using for this purpose their expressions for the Cerenkov field produced by the beam. The present authors obtain the same results more simply from the energy balance equation. A formula is derived for the energy acquired by an electron in traversing a section of the accelerator as a function of the length of the section, the time of injection, the high frequency power supplied to the accelerator, the velocity of the electrons, the group velocity of the waves, the ratio of the square of the electric field in the accelerator to the high frequency power supplied to it, the linear density of the beam,

UDC: 621.384.62

APPROVED FOR RELEASE: 07/13/2001

CIA-RDP86-00513R001549110002-8

and the damping constant of the unloaded accelerator. A formula is derived for the factor can be neglected in practical calculations. A formula is derived for the energy spread of the beam as a function of the pulse duration and the other factors mentioned above. The energy spread is maximum for a pulse duration close to $L(c - v)/cv$, where L is the length of the section, c is the electron velocity, and v is the group velocity of the waves. When the total charge in the pulse (rather than the charge density) is held constant, the energy spread increases monotonically with decreasing pulse duration. For injection of electrons into a storage ring, the energy spread can be significantly reduced when capture into the orbit takes place during a time interval that is shorter than the pulse duration. A good spectrum can also be obtained under conditions of considerable loading by cutting off the initial portion of the beam with a pulsed magnet. The authors thank A.I.Zykov, G.M.Ivanov and L.A. Makhenko for discussions. Orig. art. has: 10 formulas and 2 figures.

AUTHORS: Nemtsov, M.S.; Shenderovich, F.S.

TITLE: The modification of colophony for producing emulsifiers to be used
in the production of butadiene-styrene rubbers -

PERIODICAL: Kauchuk 1 rezina, no. 2, 1961, 4 - 11

TEXT: According to available literature data (Table 1) the authors conclude that resin acids containing conjugated double bonds have the strongest retarding effect on the process of "hot" copolymerization of butadiene with styrene. These bonds are thought to be the main reason for the disruption in the normal polymerization process and, thus, the cause of ordinary colophony being unsuitable for technical use. The main task in modifying colophony is thought to be the removal of the compounds containing the conjugated bonds. The two main chemical transformations suggested for this purpose are hydration and disproportionation (see scheme). Both processes are based on the destruction of the conjugated double bonds, either by the addition of hydrogen or as a result of its splitting-off. The disproportionation differs from the hydration in the source of the hydrogen used and the presence of compounds with an aromatic nucleus (dehydroresin acids)

Card 1/8

The modification of colophony....

in the products of reaction. Extensive research was carried out in the Soviet Union, in order to determine which of the two processes to use for the modification process of colophony and the production of colophony emulsifiers for the SR industry. Hydration work was carried out at the Yaroslavl' (Ref. 4) and Voronezh (Ref. 6) SR Plants and at the VNIISK. Disproportionation was systematically carried out at the VNIISK and at the VNIINeftekhim. The present article deals with the main summary of these works and the further methods for perfecting the developed processes. Several types of nickel catalysts were tested and the industrial "nickel on diatomaceous earth" used in the petroleum industry was found to be the most active one. Certain relationships between the pressure of hydrogen and the rate of its absorption in the hydration of colophony on the above-mentioned catalyst were derived which led to the following conclusions: 1) The maximum quantity of the absorbed hydrogen increases with the pressure of the latter assumed to be connected with the state of equilibrium. 2) The rate of hydration increases proportionately to the hydrogen pressure (Fig. 1). 3) The stoichiometric difference in the experiment at $p_{H_2} = 12$ atm between the residual content of the abietic acids (2.4%) and the quantity of the absorbed hydrogen (0.42 moles to 1 mole of acid) leads to the conclusion that at low pressures of hydrogen, simultaneously with the hydration on an active catalyst, the reactions of disproportionation may

Card 2/8

20806

S/138/61/000/002/002/008

A051/A129

The modification of colophony....

take place at a sufficiently high rate; 4) The harmful reaction of the splitting off of the carboxyl group, the specific gravity of which drops with an increase in the hydrogen pressure takes place at a sufficiently high rate simultaneously with the hydration on the nickel catalyst. The consumption of the catalyst during the hydration process was tested on two types of nickel catalyst, using two different methods of transformation depth control (Figs. 2, 3). The results seen on the graphs are explained by the fact that the initial colophony contains catalytic "poisons", which irreversibly block the active surface of the catalyst and bring about the deactivation of a certain amount of the submerged contact, the value of which depends on the concentration of the "poisons" in the colophony. Conclusions are drawn from the experimental results that the isomerization reactions of the resin acids with the nickel contact do not catalyze, i.e., they take place homogeneously (thermally). The average rates of reaction were determined in order to establish the relationship of the hydration rate to the quantity of the catalyst from the curves in the experiment with 2, 4 and 8% "Ni-Cu" of the contact (Fig. 3, dotted lines, and Fig. 4). The relationship was found to be $k = v(S - a)$, where v is the rate of reaction, k - constant of the rate of reaction, S - quantity of the submerged catalyst, % of the colophony weight, a - the quantity of the irreversibly poisoned catalyst (for the given case the value some-

Card 3/8

20806

S,138/61/000/002/002/008
AO51/A129

The modification of colophony....

what exceeds 1% of the colophony weight). The relationships are thought to explain the insufficient stability and relatively low production indices of the experimental-industrial hydration of colophony at the Voronezhskiy zhirkombinate (Voronezh Fat Combine). The authors conclude with respect to the hydration process that in the case of colophony it could be accompanied by reactions of disproportionation if the applied catalyst has sufficient activity for this purpose. In the case of disproportionation, "Ni on diatomaceous earth" proved to be applicable as catalyst yielding a product of reaction with a sufficiently low content of abietic acids. Comparisons were made of the colophonies obtained during the process of low-temperature ampoule copolymerization of butadiene with styrene according to a trilon-rongalite formulation at the VNIISK. Obtained data showed that in the first approximation both methods give satisfactory emulsifiers to the same degree. The initial non-modified colophony is unsuitable for the polymerization process. The quantity of nickel catalyst was found to have the same effect on the disproportionation process of colophony as on the hydration process, i.e., at low quantities of the contact the rate of reaction is very low. There is a partial poisoning of the catalyst (Table 4) and substantial splitting-off of the carbonic acid. A decrease in the specific gravity of the decarboxylation can be accomplished by a thermodynamic shift to the left of the state of equilibrium:

Card 4/8

20806
S/138/61/000/002/002/008
A051/A129

The modification of colophony....

$\text{RCOOH} \rightleftharpoons \text{RH} + \text{CO}_2$, achieved by increasing the partial pressure of the carbonic acid. The large batches VNIISK-produced of disproportionated colophony on "Ni on diatomaceous earth" were tested and proved to be of satisfactory quality. However, the disproportionation process on the nickel catalysts was considered impractical for industrial use, since this catalyst speeds up, in addition to the main reaction, the non-desirable splitting-off of the carbonic acid with a loss of 10% and more of resin acids. Palladium was tested in this connection to be used as a catalyst. Conclusions were drawn here that palladium is subjected to poisoning by the "poisons" present in the colophony during the process. The application of the palladium catalyst was found to decrease the raw material losses due to practical removal of the decarboxylation reactions and is cheaper as a catalyst. Experiments at the VNIISK showed that the specific activity of a unit weight of palladium exceeds that of nickel by 450 times. There are 6 figures, 6 tables and 12 references: 9 Soviet and 3 English. TITLE: Viscosity of concentrated soap pastes of disproportionated collodion

SOURCE: Kauchuk i rezina, no. 7, 1964, 21-23

TOPIC TAGS: thixotropic fluid, fluid viscosity, soap, viscous fluid, sodium compound

ABSTRACT: A study of the thixotropic properties of the sodium salt of disproportionated collodion showed that the viscosity of collodion soap pastes can vary substantially (four- to fivefold), depending on the intensity of mixing. In the mechanical mixing of structured collodion soap paste, its structural viscosity is broken down rapidly; restoration of the structural viscosity of the paste at the state of rest occurs very slowly. The temperature dependence of the viscosity of the structured paste of the sodium salt of disproportionated collodion containing 24% water is described by an equation.

TITLE: Tsunami wave registration

SOURCE: Leningrad. Nauchno-issledovatel'skiy institut gidrometeorologicheskogo priborostroyeniya. Trudy no.10. Moscow, 1961, 110-120

TEXT: The measurement of tsunami waves is hampered by the fact that they usually occur together with wind-swept and tidal waves, and these have to be screened out. As yet, no instrument exists for registering tsunamis of catastrophic force. The present paper details a solution for this difficulty with an apparatus which consists of two registrators. The first one, operated by means of a float, registers small tsunamis, while the second is hydrostatic and is activated automatically whenever a large tsunami wave approaches. Both instruments have been tested, both in the laboratory and at sea and proved to be satisfactory in all respects - they remained waterproof, successfully screened out non-tsunami waves, and did not develop defects. The hydrostatic registrator was devised so that it recorded surface movements of up to 1008 cm magnitude on a 100 mm recording band. A comparison between the two instruments is presented. The instruments were recommended for use in the Far East

TITLE: The GM-30 tsunami (tidal wave) warning device

SOURCE: Leningrad. Nauchno-issledovatel'skiy Institut gidrometeorologicheskogo priborostroyeniya. Trudy*, no. 11, 1963, 106-113

TOPIC TAGS: meteorology, tidal wave, seismic tidal wave, earthquake, tsunami, tsunami detection

ABSTRACT: In previously published papers, a method has been developed for the detection of tsunami waves arising against a background of tidal variations in the level of the sea. This method is based on the fact that the rate of change in level due to tides (ebb and flow) and to tsunami waves is different. In order to determine these rates by means of the currently used sea-level recorder (or floating tsunami recorder), the floating system of the latter converts sea level variations into displacements of a special mechanical carrier arrangement, the speed of which is measured according to the value of the braking force of a piston traveling in a cylinder with a viscous liquid. This method of speed measurement was chosen because these speeds are very small in terms of absolute magnitude and are approximately equal to 0.5 mm/min for tidal variations and 3-5 mm/min for

Card

ACCESSION NR: AT4038815

tsunami waves. Maximum and minimum rates and periods of tidal- and tsunami-caused sea level changes are discussed in the article and tables are given illustrating the maximum (and minimum) numerical values of tidal speeds at installation sites of sea level recorders and the ratio of level variation rates as caused by ebb and flow and tsunami waves for various ranges of level measurement. A method is also described for furnishing warning signals regarding the approach of tsunami waves to the installation site of tsunami or tidal wave recorders and sea level indicators. The operation of this device is based on measurement of the speed of movement of a carrier which is rigidly connected with the movement of the floating wheel of the sea-level recorder (or floating tsunami recorder) which records the sea level variations. When the level variations are of tidal origin, the carrier movements are slow, whereas with the advent of tsunami waves the movement of this carrier arrangement is accelerated, this fact being determined by means of a special device pictured and described in the text of the article, along with an explanation of its electrical circuitry. In order to achieve uniform speeds in the movement of the tsunami indicator, the floating wheel of the sea level indicator was uniformly rotated by means of an SD-2 synchronous motor (2 rpm), with rubber washers of different diameters placed on the shaft of the motor in order to ensure the necessary speeds of carrier displacement (15-mm washer to simulate "slow tsunami waves" at 2.4 cm/min; 5-mm washer to simulate "rapid tides" at 0.8

Card 2/3

ACCESSION NR: AT4038815

cm/min; 9-mm washer to simulate "intermediate speeds of level variation" at 1.4 cm/min). The results of laboratory tests using this type of set-up are described in the article. Orig. art. has: 4 figures, 3 formulas and 5 tables.

TITLE: The small GM-28 coastal tide gage

SOURCE: Leningrad. Nauchno-issledovatel'skiy institut gidrometeorologicheskogo priborostroyeniya. Trudy, no. 12, 1964. Voprosy gidrometeorologicheskogo priborostroyeniya (Problems in hydrometeorological instrument manufacture), 18-28

TOPIC TAGS: oceanography, tide, oceanographic instrument, tide gage, GM-28
tide gage

ABSTRACT: This article gives a brief description of the design of a small coastal tide gage, the GM-28, the principle of its operation and specifications and some results of its testing. The apparatus can be used either under stationary conditions or on expeditions. It is set up easily along any part of the coast. In this tide gage, fluctuations of hydrostatic pressure caused by tidal changes of sea level are transformed into the mechanical movement of an indicating hand by means of a siphon; these movements are recorded on a paper tape on a drum moved by a clock mechanism. The gage (shown schematically in Fig. 1 of the Enclosure) is a sealed automatic recorder of hydrostatic pressure. Instrument readings are

Card 1/43

L 27614-65

ACCESSION NR: AT5001379

5

unaffected by changes in the surrounding temperature because there is a temperature compensator. The instrument sits on a cast base 1. The siphon 2 is attached to the outer side of the base. The linear movement of the bottom 3 of the siphon, caused by a change of sea level, is transformed into rotational movement of the axle 4 by a rod 5 attached to the bottom of the siphon on the inner side and a plate 6 attached to the axle. The axle carries a bimetallic curved piece to which is attached an indicator 8 with a pen for recording on the paper on the drum 9 with a daily or weekly clock mechanism. The rod is supported by a bushing 10. The mechanism ensuring recording of sea level, minus the initial depth of the instrument, consists of a special nut 11, a locking/checking device and support 12, and other components. The apparatus is kept air- and watertight by a protective housing 13, bolts 14 and nuts 15. Influence of wind waves is excluded by damping. The apparatus weighs 10 kg and measures 350 x 220 x 200 mm. The time required for initial setting up of the gage does not exceed 30-40 minutes. Tests in the White and Baltic Seas have demonstrated the good operating qualities of the gage. The GM-28 is now in production. "The authors wish to thank A. S. Pchelkin, V. M. Nikitina and M. A. SOURCE: Leningrad. Nauchno-issledovatel'skiy institut gidrometeorologicheskogo priborostroyeniya. Trudy, no.14, 1965, 10-15

TOPIC TAGS: oceanographic instrument, sea water, hydrology

ABSTRACT: The authors describe the design and operational characteristics of a large sea water sampler, GM-42. The development was done by the instrument division of the NIIGMP, with the aim of producing a fairly large (54 liters) water sampler causing no sample contamination and having good operational suitability. The sampler is essentially a horizontal stainless steel cylinder with an external closure system. A general view is shown in Fig.1, Enclosure 01. The sampler passed acceptance tests in the Caspian Sea. The orig. art. has: 2 figures.

TITLE: Low inertia thermal sensor for manometric thermometers

SOURCE: Leningrad. Nauchno-issledovatel'skiy institut gidrometeorologicheskogo priborostroyeniya. Trudy, no. 14, 1965, 109-112

TOPIC TAGS: Thermometer, temperature pressure transducer, manometric thermometer

ABSTRACT: The authors discuss and evaluate a new design for a temperature-pressure transducer suitable for oceanographic applications and previously described by them in detail (Avtorskoye svidetel'stvo No 159309, Bull. Izobreteniy, no. 24, 1963). In this concept, the sensor liquid (e.g. toluol) occupies the volume between two coaxial metal tubes, instead of the conventional capillary tubing. The instrument has a much lower time constant than the conventional design. The orig. art. has 1 figure, 1 table and 6 formulas.

ABSTRACT: The author discusses the computation of errors arising in the measurement of hydrometeorological elements when the latter are represented by random functions. Errors in measurement are computed which are a function of the characteristics of the measurements made (instantaneous or average values), the characteristics of the equipment used (inertial or noninertial), and the characteristics of the random process employed (structural or correlational

"Arkh Patol" No 1, pp 89-94

Finds in cases of bacillary dysentery accumulations
of cells in intestine wall which can be defined
as myeloid metaplasia. Most of them are found in
submucous region, especially in cases showing
toxic changes such as occurrence of fibrin and

162T74

USSR/Medicine - Dysentery (Contd) Jan/Feb 50

edema. They are found before 10th day of disease
and do not depend on character of colitis or age
of patient. When myeloid metaplasia is present
in intestine wall there is corresponding change
in lymph nodes though there is no direct correla-
tion in degree. Myelosis of spleen pulp was also
observed frequently in all phases of fatal dysen-
tery, although there was no strict parallel be-
tween it and myelosis of the intestine wall.

TITLE: Experimental study of lysozyme and ecmonovocillin aerosols 44,55
SOURCE: Antibiotiki, v. 10, no. 9, 1965, 856-859
TOPIC TAGS: aerosol, antibiotic, respiratory drug, respiratory system disease

ABSTRACT: The possibility of using ecmonovocillin and lysozyme in the form of aerosols
was investigated by studying the concentration of both substances in palatine tonsils,
adenoids, washings from the nose, and blood serum of patients after aerosol administra-
tion. Lysozyme was found in high concentrations (0.34 — 2.0 mg/ml) in the lymphoid

TOPIC TAGS: electronic counter, trigger circuit

ABSTRACT: This Author Certificate presents a reversible decade counter containing triggers and transfer gates whose control inputs are connected to the addition and subtraction buses. To increase the resolving power of the counter, the carry and borrow outputs of the first trigger are connected to the one and zero set inputs of the fourth trigger and through gates to the counter input of the second trigger (see Fig. 1). The control inputs of the gates are connected to the outputs of the fourth trigger.
